Title Inverse Probability of Censoring Weights to Deal with Treatment
Switch in Randomized Clinical Trials

Version 1.0.4

Maintainer Nathalie Graffeo <nathalie.graffeo@univ-amu.fr>

Description Contains functions for formatting clinical trials data and implementing inverse probability of censoring weights to handle treatment switches when estimating causal treatment effect in randomized clinical trials.

Depends R (>= 2.10), survival (>= 2.42)

cens.ipw	<i>Censoring patient initiating the other arm treatment and building a treatment censoring indicator cens</i>
----------	---

Description

Censoring patient initiating the other arm treatment and building a treatment censoring indicator cens

Usage

```
cens.ipw(
  data,
  id,
  tstart,
  tstop,
  event,
  censTime,
  arm,
  realtrt = FALSE,
  trt.start = NULL,
  trt.stop = NULL
)
```

Arguments

data	a dataframe containing the following variables
id	the patient's id
tstart	the date of the beginning of the follow-up (in numeric format)
tstop	the date of the end of the follow-up (in numeric format)
event	the indicator of failure (a death is denoted by 1 at the end of the follow-up)
censTime	the chosen time to censor the patients (in numeric format)
arm	the randomized treatment (2-levels factor)
realtrt	the randomized treatment (2-levels factor)
trt.start	the time of initiation of the randomized treatment (NULL by default)
trt.stop	the time of termination of the randomized treatment (NULL by default)

Value

a dataframe in the long format, with the data being censored according to the input date, censTime. a treatment censoring indicator, cens, is thus added to the previous dataset to indicate such a switch. Note that this function provides the option to include in the data the treatment really taken with the corresponding dates. Then, the treatment really taken is a 3-levels factor, i.e., the two from the randomized arms and a third indicating the no-treatment case (None).

# Before censoring:
toy.long
# Ater censoring:
toy.long2
```

ipcw

*Computing the stabilized IPCweights***Description**

Computing the stabilized IPCweights

Usage

```
ipcw(
  data,
  id,
  tstart,
  tstop,
  cens,
  arm,
  bas.cov,
  conf,
  trunc = NULL,
  type = "kaplan-meier"
)
```

Arguments

data	a dataframe containing the following variables
id	the patient's id
tstart	the date of the beginning of the follow-up (in numeric format, with the first being equal at 0)
tstop	the date of the end of the follow-up (in numeric format)
cens	the indicator of treatment censoring (denoted by 1 at the end of the follow-up)
arm	the randomized treatment (2-levels factor)
bas.cov	a vector the baseline covariates
conf	a vector of time-dependent confounders
trunc	an optional fraction for the weights. For instance, when trunc = 0.01, the left tail is truncated to the 1st percentile and the right tail is truncated to the 99th percentile
type	a character string specifying the type of survival curve. The default is type=`kaplan-meier`

Value

the initial dataframe data with stabilized IPCweights as additional arguments. By default, the un-truncated stabilized weights are given. If the trunc option is not NULL then the truncated stabilized weights are also given.

replicRows	<i>Function to replicate the rows so that each patients' follow-up is split according to all event times (times parameter) up to each patient's end time</i>
------------	--

Description

Function to replicate the rows so that each patients' follow-up is split according to all event times (times parameter) up to each patient's end time

Usage

```
replicRows(data, tstart, tstop, event, cens, times1, times2, arm)
```

Arguments

data	a dataframe containing the following variables
tstart	the date of the beginning of the follow-up (in numeric format, with the first being equal at 0)
tstop	the date of the end of the follow-up (in numeric format)
event	the indicator of failure (a death is denoted by 1 at the end of the follow-up)
cens	the indicator of treatment censoring (denoted by 1 at the end of the follow-up)
times1	a vector of times (in numeric format) indicating the times according to which the rows have to be split for patients in the first arm
times2	a vector of times (in numeric format) indicating the times according to which the rows have to be split for patients in the second arm
arm	the randomized treatment (2-levels factor)

Value

a formatted dataframe with the rows replicated according to the provided times parameter

```

SHIdat

A real example dataset from the randomized clinical trial SHIVA

Description

Dataset SHIdat contains an anonymized excerpt of data from the SHIVA01 trial. This was the first randomized clinical trial that aimed at comparing molecularly targeted therapy based on tumour profiling (MTA) versus conventional therapy (CT) for advanced cancer. A switch to the other arm was scheduled to be proposed at disease progression for patients in both treatment groups.

Usage

```
data("SHIdat")
```

Format

A data frame with 197 observations on the following 306 variables.

`id` a numeric vector corresponding to the patient's identifier

`bras.f` a vector containing the patient's randomized arm

`agerand` a numeric vector containing patient's age (in years) at randomization

`sex.f` a vector containing the patient's gender

`tt_Lnum` a numeric vector containing the number of previous lines of treatment

`rmh_alea.c` a numeric vector containing the Royal Marsden Hospital score segregated into two categories

`pathway.f` a vector the molecular pathway altered (`pathway.f`: the hormone receptors pathway, the PI3K/ AKT/mTOR pathway, and the RAF/MEK pathway)

`mysps.v2,ps.v3,ps1.v1,ps1.v2,ps1.v3,ps1.v4,ps1.v5,ps1.v6,ps1.v7,ps1.v8,ps1.v9,ps1.v10,ps1.v11,ps1.v12,ps1.v`
 numeric vectors containing the ECOG performance status measured at the randomization visit, the visit before the potential switch and the planned visits (maximum number of planned visits: 21)

`mytran.v1,tran.v2,tran.v3,tran.v4,tran.v5,tran.v6,tran.v7,tran.v8,tran.v9,tran.v10,tran.v11,tran.v12, trar`
 numeric vectors containing the use of platelet transfusions at each of the potential 21 planned visits

myttc.v2,ttc.v3,ttc1.v1,ttc1.v2,ttc1.v3,ttc1.v4,ttc1.v5,ttc1.v6,ttc1.v7,ttc1.v8,ttc1.v9,ttc1.v10,ttc1.v11
 numeric vectors containing the presence of concomitant treatments at the randomization visit,
 the visit before the potential switch and the planned visits (maximum number of planned visits: 21)

tox.t1,tox.t2,tox.t3,tox.t4,tox.t5,tox.t6,tox.t7,tox.t8,tox.t9,tox.t10,tox.t11,tox.t12,tox.t13,tox.t14,tox.t15
 numeric vectors corresponding to the presence of an adverse event. tox.ti contains 1 if the
 patient started an adverse event linked with the treatment at datetox.ti, 0 if the patient ended
 an adverse event linked with the treatment at datetox.ti, and NA otherwise

ddn a vector containing the date of latest news

debtCO a vector containing the date of initiation of the other arm treatment

ddeath a vector containing the death date

ddt.v1 a vector containing the date of initiation of the randomized treatment

datt a vector containing the date of the interruption of the randomized treatment

dexac.v2 a vector containing the date of randomization

dexac.v3 a vector containing the date of the visit before the potential switch

dexac1.v1,dexac1.v2,dexac1.v3,dexac1.v4,dexac1.v5,dexac1.v6,dexac1.v7,dexac1.v8,dexac1.v9,dexac1.v10,dexac1.v11
 vectors containing the dates of the potential 21 planned visits

datetox.t1,datetox.t2,datetox.t3,datetox.t4,datetox.t5,datetox.t6,datetox.t7,datetox.t8,datetox.t9,datetox.t10,datetox.t11,datetox.t12,datetox.t13,datetox.t14,datetox.t15
 vectors containing the dates related to adverse events (as explained above)

CO a vector containing 1 if the patient changed treatment arm (i.e., did a switch)

progDate a vector containing the date of a potential progression

progStatus a vector containing 1 if the patient did a progression (and 0 otherwise)

status a vector containing the patient's status at the date of latest news (1 if died, 0 otherwise)

Details

Note that some variables were built from the original data for illustration purpose. We provided an excerpt containing only the covariates that are useful for our analysis. Note also that the SHIVA data were anonymized.

Acknowledgments: we thank the patients who volunteered to participate in this study for their dedication and the study-site staff who cared for them. This work is supported by grant ANR-10-EQPX-03 from the Agence Nationale de la Recherche (Investissements d'avenir) and Site de Recherche Integre contre le Cancer (SiRIC). High-throughput sequencing was done by the NGS platform of the Institut Curie, supported by grants ANR-10-EQPX-03 and ANR-10-INBS-09-08 from the Agence Nationale de la Recherche (Investissements d'avenir) and the Canceropole Ile-de-France.

```

timesTokeep

Function to keep all event times

Description

Function to keep all event times

Usage

```
timesTokeep(data, id, tstart, tstop, mes.cov, time.cov)
```

Arguments

<code>data</code>	dataframe containing the following variables
<code>id</code>	patient's id
<code>tstart</code>	date of the beginning of the follow-up (in Date format)
<code>tstop</code>	date of the end of the follow-up (in Date format)
<code>mes.cov</code>	list of vectors, each of them must contain the names (in character format) of the repeated measurements related to one time-dependent covariate
<code>time.cov</code>	list of vectors, each of them must contain the times (in Date format) of the date when the abovementioned measurements were done

Value

list of two lists, one in Date format the other in numeric format. Each of them contains, for each patient, the event time and the times of changes in time-varying covariates

References

Graffeo, N., Latouche, A., Le Tourneau C., Chevret, S. (2019) "ipcwswitch: an R package for inverse probability of censoring weighting with an application to switches in clinical trials". Computers in biology and medicine, 111, 103339. doi : "10.1016/j.combiomed.2019.103339"

  mes.cov = list(c("ps1", "ps2", "ps3")),
  time.cov = list(c("randt", "dt2", "dt3")))
# For example, for patient id=3, to obtain the kept times in Date format:
kept.t[[1]][[3]]
# To obtain the kept times in numeric format:
kept.t[[2]][[3]]
```

toydata

A short example dataset

Description

Dataset toydata contains repeated measurements made in 3 patients. It mimics randomized clinical trials data with two parallel arms with a repeated measurement of a time-varying binary covariate, which could be the time-varying confounder acting both on the survival and treatment censoring.

Usage

```
data("toydata")
```

Format

A data frame with 3 observations on the following 12 variables.

`id` a numeric vector corresponding to the patient's identifier

`randt` a vector containing the date of the randomization visit

`lastdt` a vector containing the date of latest news

`status` a numeric vector. The value equals to 1 if the patient dies at `lastdt` (and 0 otherwise)

`age` a numeric vector containing patient's age (in years) at randomization

`ps1` a numeric vector containing the values (0 or 1) of a repeated measurement happening on date `randt`. Note that some of them could be missing

`ps2` a numeric vector containing the values (0 or 1) of a repeated measurement happening on date `dt2`. Note that some of them could be missing

`ps3` a numeric vector containing the values (0 or 1) of a repeated measurement happening on date `dt3`. Note that some of them could be missing

`dt2` a vector containing the dates of measurement of `ps2`. Note that some of them could be missing

`dt3` a vector containing the date of measurement `ps3`. Note that some of them could be missing

`arm` a vector containing the patient's randomized arm

`swtrtdt` a vector containing the date when the patient initiates the other arm treatment (NA if does not happen)

wideToLongTDC

Function from wide to long format

Description

Function from wide to long format

Usage

```
wideToLongTDC(
  data,
  id,
  tstart,
  tstop,
  event,
  bas.cov,
  mes.cov,
  time.cov,
  times
)
```

Arguments

<code>data</code>	a dataframe containing the variables <code>id</code> , <code>tstart</code> , <code>tstop</code> , <code>mes.cov</code> and <code>time.cov</code>
<code>id</code>	the patient's id
<code>tstart</code>	date of the beginning of the follow-up (in Date format)
<code>tstop</code>	date of the end of the follow-up (in Date format)
<code>event</code>	the indicator of failure (a death is denoted by 1 at the end of the follow-up)
<code>bas.cov</code>	a vector containing the names (in character format) of the baseline covariates
<code>mes.cov</code>	a list of vectors, each of them must contain the names (in character format) of the repeated measurements related to one time-dependent covariate
<code>time.cov</code>	a list of vectors, each of them must contain the times (in Date format) of the date when the abovementioned measurements were done
<code>times</code>	a list of vectors. Each of them must contain, for each patient, the event time and the times of changes in time-varying covariates

Value

the long format version of the initial dataframe `data`. The repeated values included in each vector of the list `mes.cov` are aggregated in a variable named `aa` as the name of the corresponding list member.

```
# To obtain the times parameter, we can apply the timesTokeep function on the same
# dataframe in the wide format
kept.t <- timesTokeep(toydata, id = "id",
  tstart = "randt", tstop = "lastdt",
  mes.cov = list(c("ps1", "ps2", "ps3")),
  time.cov = list(c("randt", "dt2", "dt3")))
# Now, we can build the long format
toy.long <- wideToLongTDC(data = toydata, id = "id",
  tstart = "randt", tstop = "lastdt", event = "status",
  bas.cov = c("age", "arm", "swtrtdt"),
  mes.cov = list(TDconf = c("ps1", "ps2", "ps3")),
  time.cov = list(c("randt", "dt2", "dt3")),
  times = kept.t[[1]])
toy.long
```
